

Chartis Consulting Corporation was founded in 2008 to support investment management activities for the federal government. Today, Chartis has grown into a mature small business with capabilities and experiences that are well suited for the Border Security Technology Consortium (BSTC).

Chartis manages complex information technology initiatives at US Customs and Border Protection, and our other clients. We apply our project and financial management expertise to successfully develop, evaluate, and execute technical strategies. Chartis prioritizes investments that deliver the optimal strategic benefit and ROI; with an emphasis on schedule, fiscal and operational considerations. We provide comprehensive support throughout the system development and investment lifecycles. When substantive changes to systems are enacted, Chartis transforms the pertinent governing processes to reflect those changes. Chartis measures the actual impact of technical strategies and manages the requisite business transformation activities.

Chartis engineers and deploys IT systems at DHS data centers. We successfully consolidate and modernize mission critical systems for DHS components and civilian agencies. Chartis provides IT services in the following areas:

- Infrastructure Engineering and Delivery;
- Application Migration; and,
- Data Center and Field Support Services.

Chartis is a small business prime on the DHS TacCom Contract under Technical Category 3, Infrastructure Services. In addition, Chartis maintains a network of large and small technology companies that focus on providing innovative solutions to address the operational challenges faced by homeland security, defense and first responder entities.
