

Sentrillion Corporation (Sentrillion), headquartered in Reston, Virginia, provides integrated technology solutions for national security, critical infrastructure and vital network communications. Whether it's protecting our nation's borders, seaports and airports; securing critical facilities, assets and systems, or providing essential wireless support services - we've got it covered.

For nearly a quarter of a century, we have been helping secure America's borders and safeguard our national assets. Our full-lifecycle physical security solutions are critical to protecting the nation and its citizen. We develop strategies and implement solutions that increase safety and security, save time, decrease cost and improve outcomes. We also provide telecommunications services that leverage secure wireless communications to increase capacity and improve performance for government and commercial customer.

Further, with a long history as a prime contractor for U.S. Customs and Border Protection (CBP), we have set the standard for surveillance systems at the U.S. land ports of entry and implemented similar standardized technology into other critical CBP locations (e.g., U.S. Border Patrol stations, seaports, airports, and other vital assets). During our time supporting CBP, we have been charged to continually evaluate new technology and to determine how it can efficiently and cost-effectively be implemented to modernize the surveillance platforms at critical CBP operational locations. As such, we test existing and emergent technologies for adherence to CBP operational requirements, interoperability with CBP's existing deployed technologies, and conformance with government information technology security standards. Technologies that have passed the rigors of our evaluation process are implemented as part of the continually refreshed surveillance platform.
