Spatial Integrated Systems, Inc. (SIS) is a small Research, Development, Test and Evaluation (RDT&E) business that specializes in program management and technological support in the integration of complex software and hardware systems. SIS develops innovative technology solutions directly related to design, engineering, maintenance and training applications with specific emphasis on intelligent autonomy software and sensor systems. These technologies often formulate the basis of system solutions for projects that lead to new methods for acquiring and exploiting sensory data, to realization of process improvements, and to training practices that minimize dependency on traditional practices.

SIS is currently working multiple high-profile programs for the US Navy involving intelligent autonomous control of vessels in the execution of missions with no humans onboard. Additionally, multiple vehicles can be outfitted with the system to enable coordinated and cooperative mission execution under the control of a single human operator. SIS is also the prime contractor on a USCG program to provide Maritime Domain Awareness capability using unmanned systems.
